**Dengue (IgG, IgM and Ns1Ag) - Rapid Test**

|                                                                               |                       |          |
|-------------------------------------------------------------------------------|-----------------------|----------|
| DENGUE IGG<br><i>Method - Immunochromatographic , Sample - Serum</i>          | NEGATIVE              | NEGATIVE |
| DENGUE IGM<br><i>Method - Immunochromatographic , Sample - Serum</i>          | NEGATIVE              | NEGATIVE |
| DENGUE NS 1 ANTIGEN<br><i>Method - Immunochromatographic , Sample - Serum</i> | <b>POSITIVE ▲ (H)</b> | NEGATIVE |

**"INTERPRETATION**

1. NS1 Positive: Suggestive of acute dengue infection (usually within first 5–7 days of illness).
2. IgM Positive: Indicates recent dengue virus infection.
3. IgG Positive: Indicates past infection or secondary dengue infection (interpret with clinical correlation).
4. NS1/IgM/IgG Negative: No dengue marker detected. Early infection cannot be ruled out.

**LIMITATION**

1. This is a qualitative rapid immunochromatographic test; results should be interpreted with clinical findings and other laboratory investigations.
2. Negative results do not exclude dengue virus infection, particularly if the sample is collected very early (<5 days of fever) or late in the illness.
3. Cross-reactivity with other flaviviruses (e.g., Japanese Encephalitis, Zika, West Nile) may occasionally occur.
4. Confirmation by ELISA / RT-PCR is recommended for definitive diagnosis as per ICMR/NVL protocol."
